Determine if an End-User has Admin Privileges

Use the services layer to determine if an end-user running your installation has admin privileges. This would require use of the SecurityService. The example below shows how to accomplish this within a Custom Code Rule.

```java
package com.zerog.ia.customcode.rules;

import com.zerog.ia.api.pub.CustomCodeRule;
import com.installshield.wizard.service.ServiceException;
import com.installshield.wizard.service.security.SecurityService;

public class IsAdminRule extends CustomCodeRule
{

  public boolean evaluateRule()
  {
    System.err.println("Checking for Admin Privs...");

    // Retrieve an instance of the SecurityService
    SecurityService ss = (SecurityService) ruleProxy.getService(SecurityService.class);

    boolean returnVal = true;
    try
    {
      returnVal = ss.isCurrentUserAdmin();
    }
    catch (ServiceException e)
    {
      System.err.println("Something went wrong in the Admin Privileges check.  Returning true");
      e.printStackTrace();
    }
    return returnVal;
  }
}
```

For more information on Custom Code, please navigate to the InstallAnywhere product user guide via online help or refer to the custom code samples and templates that ship with the product, located in the following directory: "InstallAnywhere Home"/CustomCode
